Effect on Information Technology Social Behavior of the Teen

Maidin Gultom
Lecturer, Faculty of Law, University of Catholic Santo Thomas Medan, Indonesia

Abstract:
Media information was threatening the youth, in which more and more is not dammed up flow of information along with the easy acquisition of information technology. Teens can easily consume information about anything. Certainly, almost all teenagers in the city are already familiar with mobile phones, even changing the model according to the latest trends. Internet can be accessed to remote, anywhere and anytime. The Internet provides a variety of information and knowledge in accordance with user needs only one double-tapping the keyboard keys. Attitudes and behavior of adolescents constructed from information obtained from the environment. Teens perform illicit acts such as fraud, violence, rape and others. This can be overcome by: use to master the technology for more intents relationships with friends or people you know who have previously been in the real world. Do not be obsessed to search for new friends on Facebook, Twitter, or other social media because of the tendency that happens, you know they are only virtual world will not give the value of the mutual friendship or mutual support between one and the other in the real world. If you want to find new friends virtual world, look for positive community who often encounter in the real world or commonly known as gathering or ground coffee. Communities like this is really going to hone your communication skills as these communities often gives us inspiration and support optimal in your life.

Keywords: Information Technology, Social Behavior, Teen

1. Introduction

Adolescence is a period full of challenges and not everyone can pass through those times. There are at least three challenges that will shake adolescence. First, the authority. At this time, teens tend to be dependent. Teens will be much buffeted by other authorities are able to influence his behavior. The independence gained through the appreciation of the authority of parents, peers, teachers and the elder person. Second, emotional stimuli. Adolescents showed emotional instability so easily influenced by emotional stimuli outside himself. Teens will be compelled to act aggressively simply incited by best friends. Third, ego. Teens tend to show ego in others. Needs to be recognized can ensnare teenager on actions that are prohibited by norms. In other words, teenagers may commit acts that violate the norms of her origin can be recognized by others. Three challenges at the very top allows teenagers banged on shaky position: perform a variety of behaviors that deviate from the norms that exist in society.

At the present time, there is a big challenge that can roll up anyone who is not competent to control it, which is information. Indeed, not only teenagers who will be affected by the progress of this information. But, the media information will complement the triple threat challenge as described above. Characteristic for this challenge is increasingly dammed up flow of information along with the easy acquisition of information technology. Teens can easily consume information about anything. Certainly, almost all teenagers in the city are already familiar with mobile phones, even changing the model according to the latest trends. Internet can be accessed to remote, anywhere and anytime. The Internet provides a variety of information and knowledge in accordance with user needs only one double-tapping the keyboard keys.

Television became the service provider information that is most widely consumed, especially a lot of mobile phones that already have facilities that live images. The print media vary in number and capable of meeting a variety of hobbies and interests of each person. The rapid information flows in all directions of social space in the community will certainly affect the user's information. Information that will affect how your materialized view, attitude, behavior, lifestyle, and habits of a person. For example, learning does not have to face to face in the classroom but could remotely via the Internet (e-learning). Shopping does not have to go to the supermarket but but can be done in the room by using the services of online shopping. In touch no longer have to wear a letter via post but can immediately use the short message service (SMS) or e-mail.

Efficiency in various fields, especially in the matter of time, effort and cost through speed and accuracy of information, as well as improved physical performance could have been very drastic, while means have been able to make efficient use of space in the sense of space. The appearance of the concrete facts of a situation and conditions that can be accessed from different places simultaneously and with indefinite duration, has been annulled will be doubts about the existence of human honesty. In fact, honesty itself which was only partially can be detected through the eyes, at the present time with the ability of technology capable olaboration wave of emotion,

in order to identify the level of honesty that is implemented. The life of the future will largely be lulled by the information technology advance.

As a process, globalization takes place through a two-dimensional, the interaction between nations, the dimensions of space and time dimensions. Dimensional space can be defined distance closer or narrowed while more time is shortened in the interaction and communication on a world scale. It is certainly not without the support of the rapid pace of development of increasingly sophisticated technologies, especially information and communication technology (ICT). Information and communication technology (ICT) is the main support for the implementation of globalization. With the support of information and communication technology, information in any form and for various purposes, can be spread easily so it can quickly affect the worldview and lifestyle to the culture of a nation. The speed of information flow that quickly overwhelm us as though not provide the opportunity for us to absorb the mental filters and a critical attitude. Increasingly sophisticated technological support, the greater the flow of information can be streamed with the global reach and impact. Therefore, it is known principle of "free flow of information" in the form of a two-way process that is fairly balanced which can mutually influence each other.

The impact of globalization with the support of information technology as a double-edged sword in one hand we can not deny the benefits and threats brought, so the benefit is also called a positive influence and the threat of so-called negative influence. Positive influence can be felt in the presence of Information Technology is an increase in speed, precision, accuracy and convenience that provide efficiency in various fields, especially in the matter of time, effort and cost. As an example of the manifestation of Information Technology is easily seen around us is sending letters require only a short time, because the presence of electronic mail (e-mail), precision of the calculation can be improved by the existence of numerical computing, managing large amounts of data can also be done easily is the database (database), the economic activity has been done, that was E-banking, E-comerce, e-shopping and much more. Community groups that maniac on the development of information technology, has a very high ability to provoke, and gives effect to the environment. With herbs sophistication and practicality offered, as well as the understanding of the economic benefits provided through the ease and efficiency posed by these advances, has been able to drag the environment to be his followers, so that a member which indirectly became more fanatical about their reliance on technology development.

2. Negative Impact of Information Technology for Social Behaviour of the Teen

The development of communication technology, particularly for the majority of people actually have a negative impact on the quality of relations between. People are much more comfortable gathering of friends active in the virtual world than the activities of a real organization that can provide the quality of the friendship more concrete and intents. Like facebook as exemplarily case. Many people who have hundreds or even thousands of friends on facebook but in the real world, they only have a few close friends who accompany their daily lives. This is one of the negative impact facebook hitherto may not have been recognized by some people. They have lost the ability to blend in with the community and tend comfortable with online life. Yet if there is one crucial thing in our life, which can help us are not the ones that we know the virtual world but the people who live around us.

While the negative effects that could arise because of the Information Technology for example economic aspects of globalization, the opening of the free market allowing entry of foreign products with ease. With so many foreign products and more relatively cheaper prices can reduce the sense of love of society for domestic products. With the loss of the love of the domestic product showed reduced symptoms of our society a sense of nationalism against the Indonesian people and financial fraud and burglary via electronic media is also a result of economic activities more easily.

Can be used as a pretext that violence by adolescents affected by violence in television shows. It took some careful research on this subject. However, when referring to the theory of constructivism, a variety show in television violence can not be underestimated, let alone set aside rather than deny nothing to do with violence by adolescents. Attitudes and behavior of adolescents constructed from information obtained from the environment. While television has become the media may not be removed from the everyday people, it presented many impressions in the less educated even many colored scenes of violence. Information celebrities preach violence: divorce or violence committed between artist. Studded with violence on television news: a dispute between residents of the village, differences in views between   organizations of society, the feud among the supporters election, forced evictions and demonstrations that led to physical clashes. The film is not enjoyable without violence, even films screened on our television most of Hollywood are full of scenes of violence. Soap opera soap opera tells a lot of physical and psychological violence (slander, spite, envy, hypocrisy). Dialogue and discussion on television emboldened indulgence in violence psikhis through mutual cornering and mutual fishing anger.

3. Countermeasures

We need to be balanced active life in the virtual world with a relationship and communication intents with the community around us. Thus we would not be fragmented by narrow ties and we will not lose the ability to communicate with others. Abatement is a way:

1. Use technology to master for more intents relationships with friends or people you know who have previously been in the real world. Do not be obsessed to search for new friends on Facebook, Twitter, or other social media because of the tendency that happens, you know they are only virtual world will not give the value of the mutual friendship or mutual support between one and the other in the real world.
2. If you want to find new friends virtual world, look for positive community who often encounter in the real world or commonly known as gathering or ground coffee. Communities like this is really going to hone your communication skills as these communities often gives us inspiration and support optimal in your life.

Changing times into the information age has a big hand in shaping the attitudes and behavior of adolescents. Uncontrolled information technology roles and functions also affect the behavior patterns of teenagers who ignored the norms. That is, the deviant behavior is

not solely derived from the teens themselves. However, the changing times can potentially spur teens behave and act beyond the limits of normativity. Disclosure of information and communication technology along with the development of information and communication may not be the only cause, but it is one of the causes which determine. More decisive because, one-sided information to a heavy attack recesses of life to the most private and sacred, on the other hand adolescents lack the ability autonomous in choosing normativity attitudes and behavior. Again, one side of the information provider agencies hit hard living space in the public sphere, on the other hand the institutions that have the authority and the norms of religion in society is getting weaker. In response to adolescents with deviant behavior would be wise if not solely place the juvenile as a suspect. Probably yes, that deviant behavior of adolescents does not appear if there is no behavior displayed teens themselves. But maybe not, that deviant behavior by adolescents influenced by the surrounding conditions. Environment around adolescents as a catalyst that enables teenagers misbehaving. In this case the juvenile was placed as a victim of his environment. So, no empathy that can be shown to the victim than by way of defending the victim. His defense was:

First, create an environment that is capable of forming adolescent awareness autonomous normative. With hope, adolescents are able to determine the choice of behavior in its sole discretion by relying on the norms in force. In this case the teenager is expected to have a normative intelligence, ie the ability of teens to determine the attitudes and behavior of any kind with regard to the norms fixed. Second, strengthen the institutions that have the authority norm. Institutions are expected to shore up the norms that exist at the same time to adjust according to the changing times. Here the role of the family as an institution that has the authority norm really important. Given that, the family is the first and foremost institution that introduces teenagers to the norms. No less important is the family of schools. At this school institutions helped families devote expectations. School is an institution that is intentionally designed to educate teens can socialize in the community so well. If we really explosive defend, the indication can be started from the simple: we feel, deviant behavior of adolescents, such as violence perpetrated upon young girls, really disturbing. It is only as a substitute for the words that seem rhetorical: we feel, such behavior seriously shred of conscience.

4. Conclusion

1. Children in the community is a bearer of happiness, it can be proved in any wedding ceremony, there is a blessing and the hope that two beings or the bride and groom have children. As well as the customary law community Batak, found umpasa (expression) as follows: "Star na rumiris tu ombun na sumorop, children pe Antong riris, Boru pe Torop." Children born, is expected to not be a thug, a thief or pickpocket, or sprawl (vagrants and beggars), but is expected to be useful for the child's family in the future, which became the backbone of the family, carrying the family name, even hope homeland.

2. Children are the hope of the nation and when the time has come to replace the older generation in continuing the life cycle state, thus, the child needs to be nurtured properly so that they are not wrong in later life. Each component of the nation both government and non government has an obligation to seriously pay attention to the growth and development of children. The components that have to provide guidance for all children is the parents, family, community, and government.

3. Young people can easily consume information about anything. Certainly, almost all teenagers in the city are already familiar with mobile phones, even changing the model according to the latest trends. Internet can be accessed to remote, anywhere and anytime. The Internet provides a variety of information and knowledge in accordance with user needs only one double-tapping the keyboard keys. Attitudes and behavior of adolescents constructed from information obtained from the environment. Teens perform illicit acts such as fraud, violence, rape and others.
